

CAMPOS®

Stretch knitted fabric.

BAMBOO

It is a sustainable fiber since it is obtained from bamboo pulp, a plant that grows very quickly and requires very little maintenance since it does not need pesticides or fertilizers. Once the bamboo is collected, it is crushed and subjected to a viscose process that gives rise to a soft mass, the pulp of bamboo. This is transformed by another process into bamboo threads of different sizes. The fiber obtained is biodegradable, which means that it can be fully degraded in the soil. It gives the fabric a soft and fresh touch and a luminous appearance. In addition, the bamboo yarn is highly absorbent and breathable. Despite its softness, the bamboo thread is resistant and highly durable over time. Bamboo fibers have natural antibacterial properties, which helps reduce odors and keep clothes fresh. It is also a hypoallergenic fiber, which makes it suitable for people with sensitive skin or health problems.

FIBER PROPERTIES

- Antibacterial
- Biodegradable
- Soft
- Odor inhibitor
- Cool
- Brightness
- Moisture absorption
- Breathable
